

# 72161

## Soil

### 250 grams

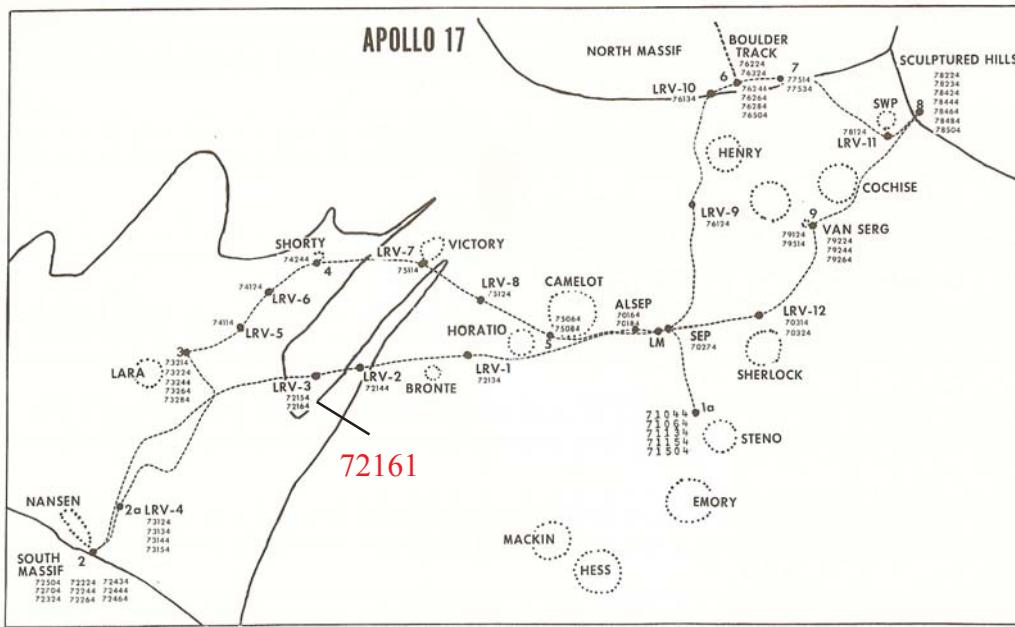

Figure 1: Location of soil sample 72160 at LRV-3 on Apollo 17 map (Meyer 1973). S73-24071

## Introduction

Soil sample 72160 – 72164 was collected from the mare surface at LRV-3 (figure 1).

## Petrography

Morris (1978) determined the maturity index ( $I_s/\text{FeO} = 87$ ). Basu et al. (1975) performed a detailed study, finding that the agglutinate content (31%) was generally less than expected for a very mature soil.

## Chemistry

The bulk composition of 72161 is intermediate between mare and highland material (figures 2 and 4).

Moore et al. (1974) determined 200 ppm carbon (figure 3). Basu et al. (1975) studied the distribution of hydrogen and carbon, finding that it was very high in the finest fraction. This is a very mature soil.

## **Modal content of soil 72160 (90-124 micron).**

*From Basu et al. 1974.*

	72161
Agglutinates	31 %
Basalt	2.4
Breccia	51.9
Plagioclase	3.8
Pyroxene	2.4
Glass other	8.5

## Cosmogenic isotopes and exposure ages

Eldridge et al. (1975) determined the cosmic-ray-induced activity of  $^{22}\text{Na} = 190 \text{ dpm/kg}$ ,  $^{26}\text{Al} = 166 \text{ dpm/kg}$  and  $^{54}\text{Mn} = 220 \text{ dpm/kg}$ .

## Other Studies

Silver (1974) determined the U, Th and Pb isotopes.

Heymann et al. (1974) reported the rare gas content.

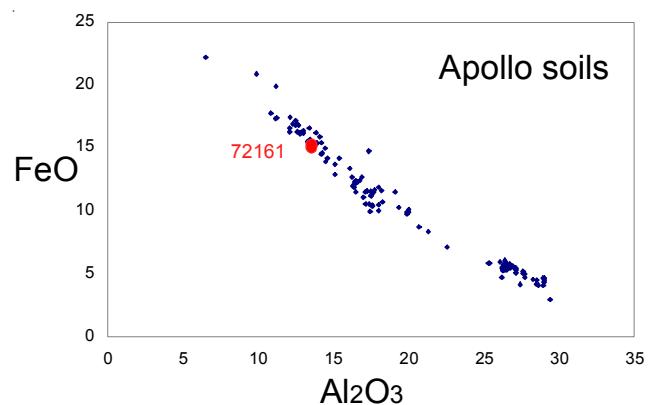

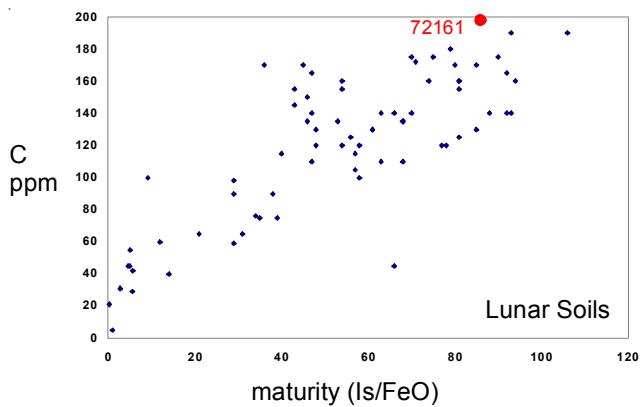

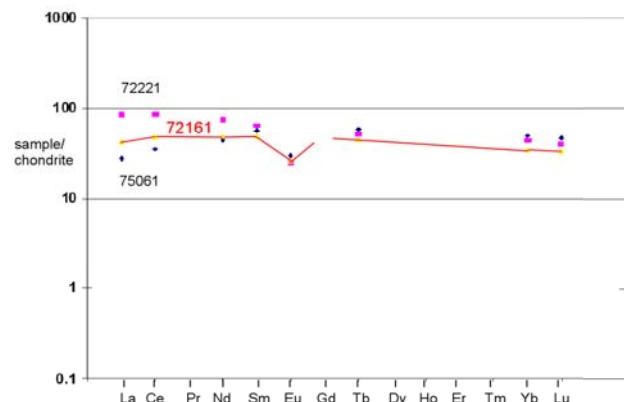

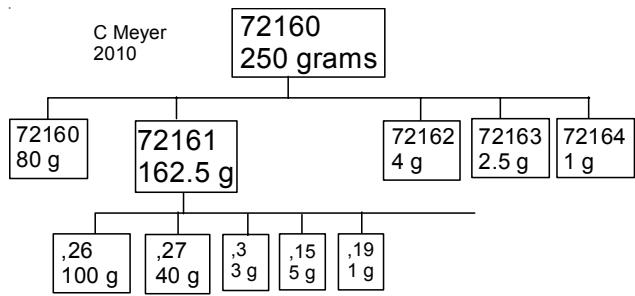

Figure 2: Composition of 72161 compared with other soil samples from Apollo missions.
